

Woolwax™ Applicator Spray Gun Guide.

Slim Jim Gun- This is our most basic inexpensive model applicator. Good for general spraying of large surfaces, or for testing products. Not designed for extension wands. Fair atomization of product. Works well with lower viscosity products (XLV, Hard-On) on flat surfaces (plows, machinery, undercarriages, equipment)

Standard Spray Applicator Gun - Another basic inexpensive model applicator. Good for general spraying of large surfaces. Not designed for extension wands. Fair atomization of product. Works well with most viscosity products on flat surfaces (plows, machinery, undercarriages, equipment.)

Standard Plus Spray Applicator Gun - Another basic inexpensive model applicator. Similar to the “Standard Gun”, however this model has a built-in air pressure dial on the gun frame to adjust spray pattern. Good for general spraying of large surfaces. It does come with a 14” flexible straight open-end wand for extra reach. There are no longer, or 360° extensions for this model. Fair atomization of product. Works well with most viscosity products on flat surfaces (plows, machinery, undercarriages, equipment.)

Woolwax™ Pro Applicator Gun – This has been the most popular undercoating gun in the industry for over 20 years. With this gun you can professionally undercoat any vehicle. Developed to accommodate extension wands to spray inside inaccessible cavities. Come with an 18” wand with a 360° nozzle to completely coat frames, rockers, and all those hard to get to cavities. Also comes with a 24” straight open-end wand for extra reach. Includes (3) empty quart bottles. Bottles and most parts are replaceable and in stock. This is the gun for most Do-it-yourself undercoaters.

Woolwax™ Supreme Undercoating Gun – When you step up to the “metal cannister” spray guns, you realize the benefit of a pressurized canister pushing the coating through the extension wands, and not just relying on the siphon tube, as with the plastic cannisters on the Pro Gun. For more active Undercoaters that find themselves using the extension wands often, the Supreme gun will provide far superior performance when using extension wands. We offer this Woolwax™ Supreme gun at an incredibly great value.

Woolwax™ Supreme Plus Undercoating Applicator

Woolwax™ Supreme Plus Undercoating Gun. - This applicator gun will atomize almost any coating with no issues at all. It has all the bells & whistles. Two-stage trigger. Separate adjustments for air and fluid. It comes with an entire assortment of extensions and hoses to handle any application. Almost every replacement part is stocked and available from Kellsport Products.

Questions ? Call us anytime at T: 888-341-4600

We often get asked what is the difference between the Supreme and the Supreme Plus applicator guns?

We try to offer the absolute best value in high quality undercoating guns. We develop and manufacture the products to fit a particular price point. The Supreme will perform every bit as good as the Supreme Plus. However, to keep the cost lower on the Supreme model, we use alloys, fittings, and accessories that will allow us to offer a terrific price point value. The Supreme model has some imported components (nothing from China), and the USA. The Supreme Gun is the best *value* in the industry.

The Supreme Plus is a precision tool made in Italy, with some additional components fabricated in USA. This is an extremely rugged tool that comes complete with an entire assortment of nozzles and extension hoses. For those that must have “the best”, this is it.

Why so many spray applicator guns? Some are very similar.

Kellsport Products / Woolwax™ manufactures spray applicator guns and accessories for many applications. Not just auto undercoating. Our spray guns are used to apply coatings to heavy equipment, bridge bearings, I-beams, and to spray everything from insecticides to disinfectants, to automotive coating. Some materials are very thin and low viscosity, and others are long-term viscous coatings like original Woolwax™.

Summary:

The 1st (3) applicators (Slim Jim, Standard, Standard Plus) are not recommended for a full body undercoating job because they do not have adequate extension wands to get inside the cavities. These models are great for large accessible surfaces such as plows, machinery, undercarriages, equipment, I-beams, etc.

Pro-Gun- This should be the “go to” for most Undercoaters, and even the Do-it-yourselfer that will be Undercoating their own vehicle. It is the perfect combination of performance and price. It includes the extension wands needed to get inside the cavities. There are also inexpensive plastic quart bottles available for those that prefer to have extras filled and ready to go.

Supreme Spray Gun: This is the best version of quality at a reasonable price. Metal pressurized cannisters can propel the coating at a much higher velocity. Pushing viscous coatings through that extra 2+/- feet of extension wands can be a bit challenging in the colder weather. The Supreme gun is a proven workhorse and will perform extremely well with almost any coating, under any conditions.

Supreme Plus Spray Gun: Highest quality precision tool Made in Italy. This model comes with a more extensive selection of extension wands, hoses and tips than any of our other models. For those that are in the Undercoating business, or others that plan on doing a fair amount of Undercoating, the Supreme Plus will serve you very well. Besides the incredible high quality, this model comes complete with the largest assortment of attachments.

**** Air regulators are not included with any of our spray guns. It is highly recommended that you do use a regulator. As the temperature changes in the cannister due to the cold compressed air, and the viscosity changes, you will find it much easier to adjust the psi at the gun end. Our spray applicators all take a standard ¼" air regulator available locally. We also offer them as an option.**

FAQ on Kellsport Products / Woolwax Spray Guns:

What size compressor do I need?

Woolwax™ undercoating guns do not require much pressure. 70 – 90 psi is usually adequate. Approximate air consumption is 5-8 CFM. Sometimes the extension wands require a bit more pressure if it is cold out. Even small compressors generally operate at about 125 psi. More important is the tank size. If the tank is very small, you will be constantly waiting for the compressor to recover. Any compressor with a tank 3 gallons and larger will work fine. If the compressor is adequate for spray painting, it will work fine for vehicle undercoating.

Pro Gun:

Are there longer extensions available? No. This gun relies on the siphon tube only to propel the liquid, since the cannister is not pressurized. The length of the hoses is limited by the amount of velocity that the gun is capable of.

Do you carry replacement parts? Yes. We stock all the basic (nozzles, hoses, bottles) parts for the Pro model gun.

Supreme Gun: Do you carry replacement parts? Yes. We stock all the basic (nozzles, hoses, bottles) parts for the Supreme model gun.

Supreme Plus Gun: Do you carry replacement parts? Yes. We stock all the basic (nozzles, hoses, bottles) parts for the Supreme Plus model gun.

Are the accessories for the Supreme and the Supreme Plus models interchangeable? No. These frames are cast for us by completely different suppliers. Most fittings, cannisters, and connectors are not compatible.
